Gloripa®
Empagliflozin

Objectives:

- Case
- Brief review of kidney role in glucose homeostasis
- SGLT2 & SGLT2 inhibitors
- Efficacy Studies
- EMPA-REG OUTCOME
- EMPA-REG RENAL
- EMPEROR- Reduced
- Guidelines Recommendations
- Administration, Cautions, Side effects
- Conclusion

Case

- **Background**
  - A **70** y/o man with **type 2 DM** diagnosed **7** years ago
- **Medical History**
  - **Hypertension** since **15** years ago
  - No history of ASCVD
- **Surgical History**
  - Neg.
- **Social History**
  - Retired pilot
- **Physical Exam**
  - BMI: **26** kg/m^2
  - BP: **140/70** mmHg

Lab Summary		
Glycemia	HbA1c	**7.5** %
	FBS	**140** mg/dl
Lipid Profile	Total Chol	**250** mg/dl
	HDL-C	**60** mg/dl
	LDL-C	**110** mg/dl
	TG	**400** mg/dl
Renal Function	UACR	**310** mg/gr
	eGFR	**40** ml/min/1.73 m^2
	Cr	**1.8** mg/dl

Current Medications	**Metformin 2000 mg/daily**
	Amlodipine 5 mg/daily

abidi DIABETES

Case

What Is the Most Appropriate Treatment for Glycemic Control?

A. Continue metformin therapy and add Empagliflozin

B. Discontinue Metformin and Switch to

Linagliptin 5mg once daily

C. Discontinue Metformin and Switch to combination of Linagliptin and Empagliflozin

D. Others

Patient History

- **70** Y/O male, **T2DM**, **HTN**
- HbA1c: **7.5** %
- FBS: **140** mg/dl
- eGFR: **40** ml/min/1.73 m^2
- UACR: **310** mg/g
- Cr: **1.8** mg/dl
- Total Chol: **250** mg/dl TG: **400** mg/dl
- HDL-C: **60** mg/dl LDL-C: **110** mg/dl
- Medications: **Metformin 2000 mg/daily; Amlodipine 5 mg/daily**
- BMI: **26** kg/m^2
- BP: **140/70** mmHg

abidi DIABETES

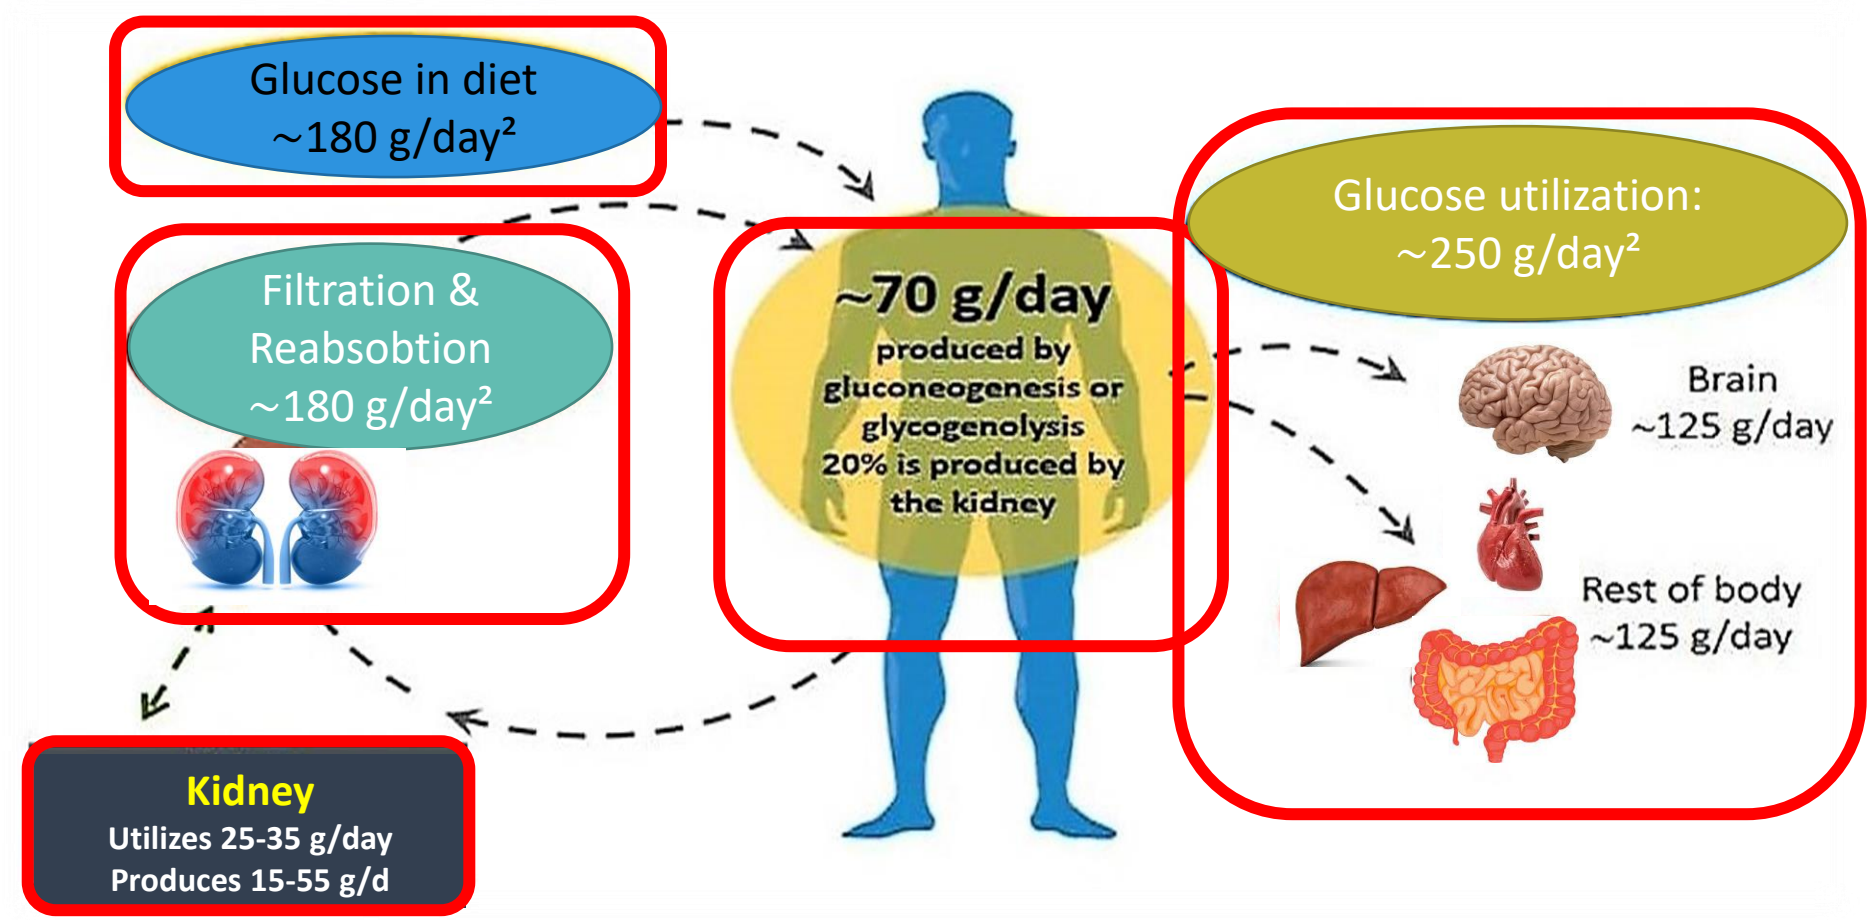
DIABETES

Kidney Plays a Significant Role in Glucose Balance

Reabsorption[1]

Production[1]
(Gluconeogenesis)

Utilization[1]



1-Gerich JE. Role of the kidney in normal glucose homeostasis and in the hyperglycaemia of diabetes mellitus: therapeutic implications. Diabetic Medicine. 2010; 27(2):136-42.
2-Wright EM et al,. Active sugar transport in health and disease. Journal of internal medicine. 2007; 261(1):32-43.

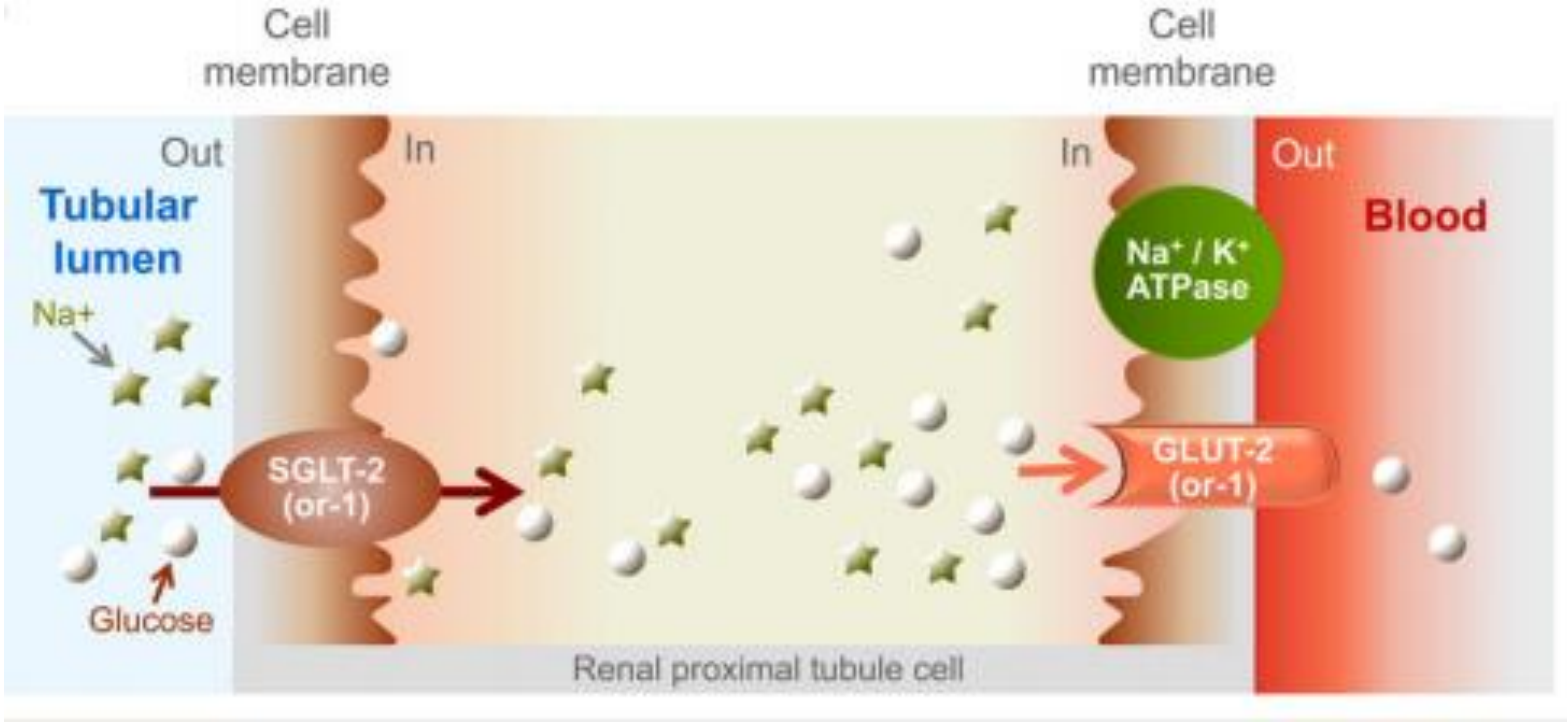
SGLT2 & SGLT2 inhibitors

Glucose Transporters

They are classified into two families[1,2]:

facilitative glucose transporters (GLUTs)

sodium-dependent glucose transporters (SGLTs)



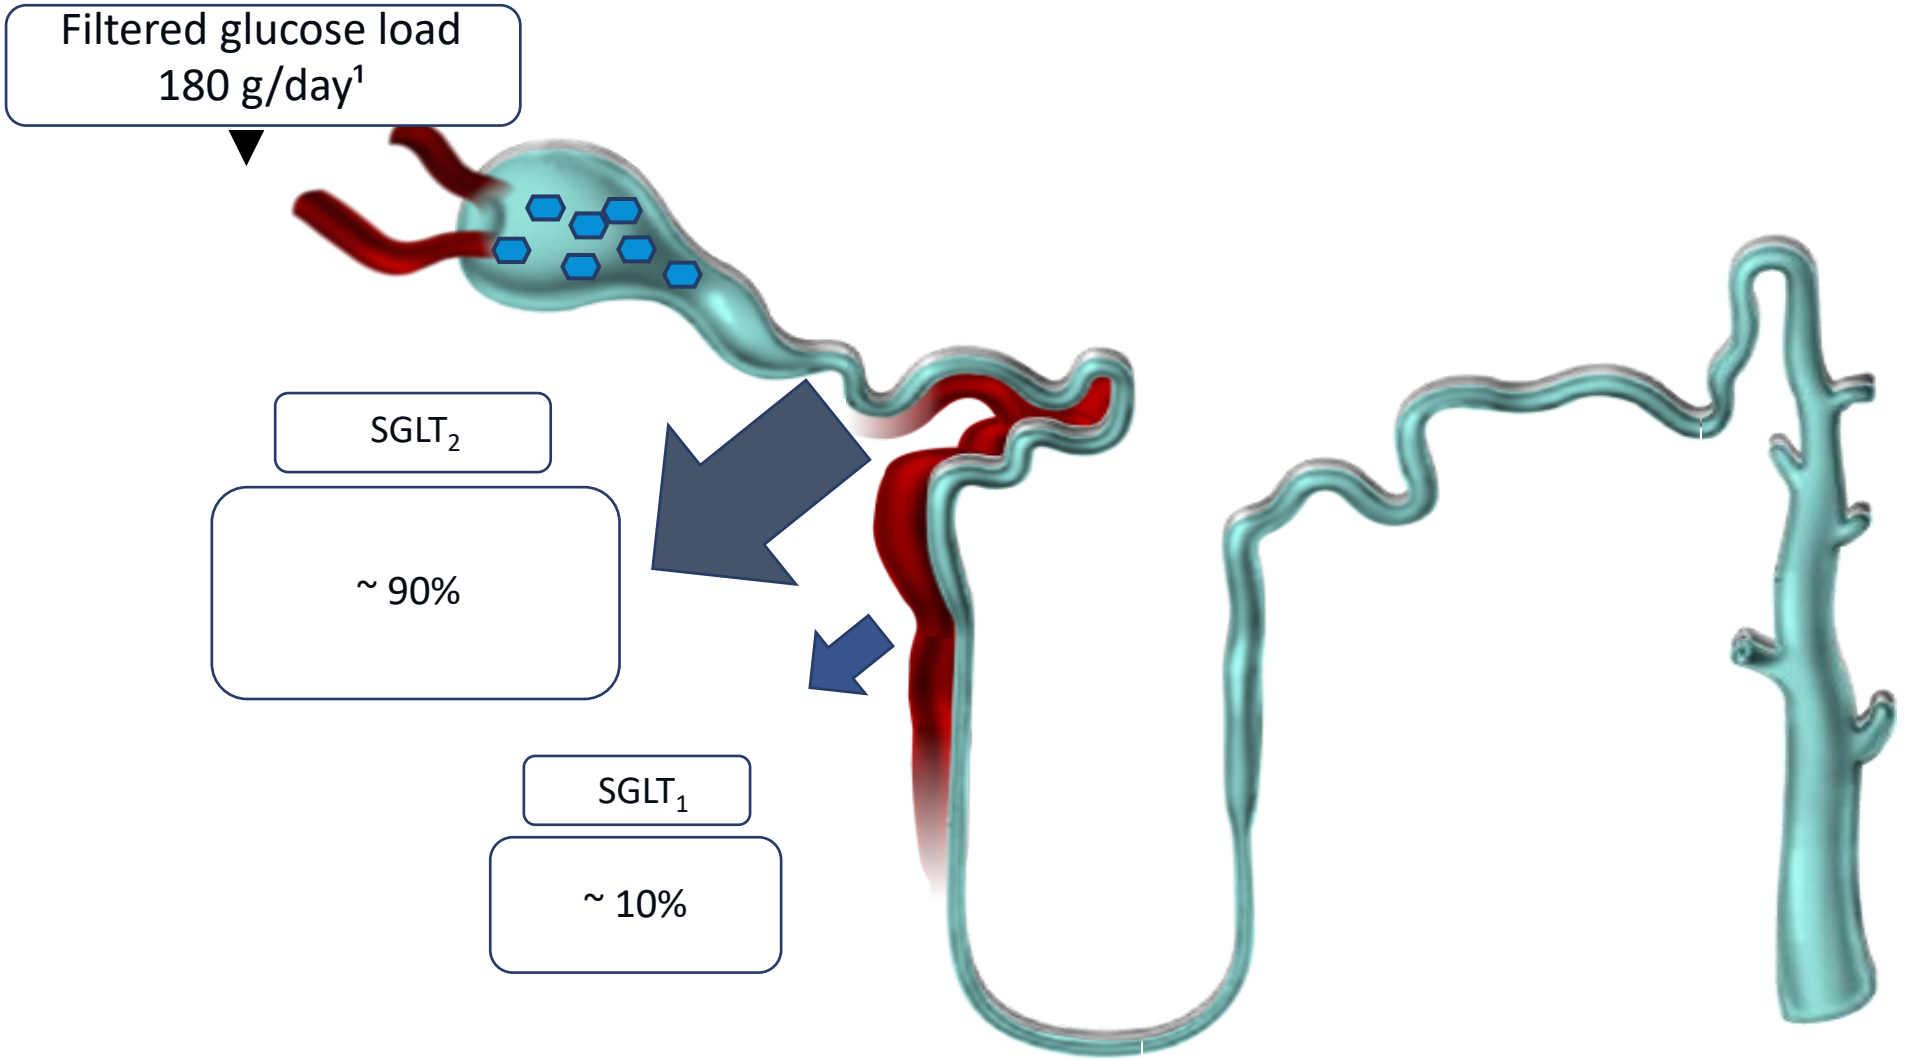
$SGLT_1$: low capacity, high affinity, mostly in intestine

$SGLT_2$: high capacity, low affinity, mostly in kidney

1-Bays H. Sodium glucose co-transporter type 2 (SGLT2) inhibitors: targeting the kidney to improve glycemic control in diabetes mellitus. Diabetes Therapy. 2013; 4(2):195-22

2-Nair S et al,. Sodium glucose cotransporter 2 inhibitors as a new treatment for diabetes mellitus. The Journal of Clinical Endocrinology & Metabolism. 2010; 95(1):34-42.

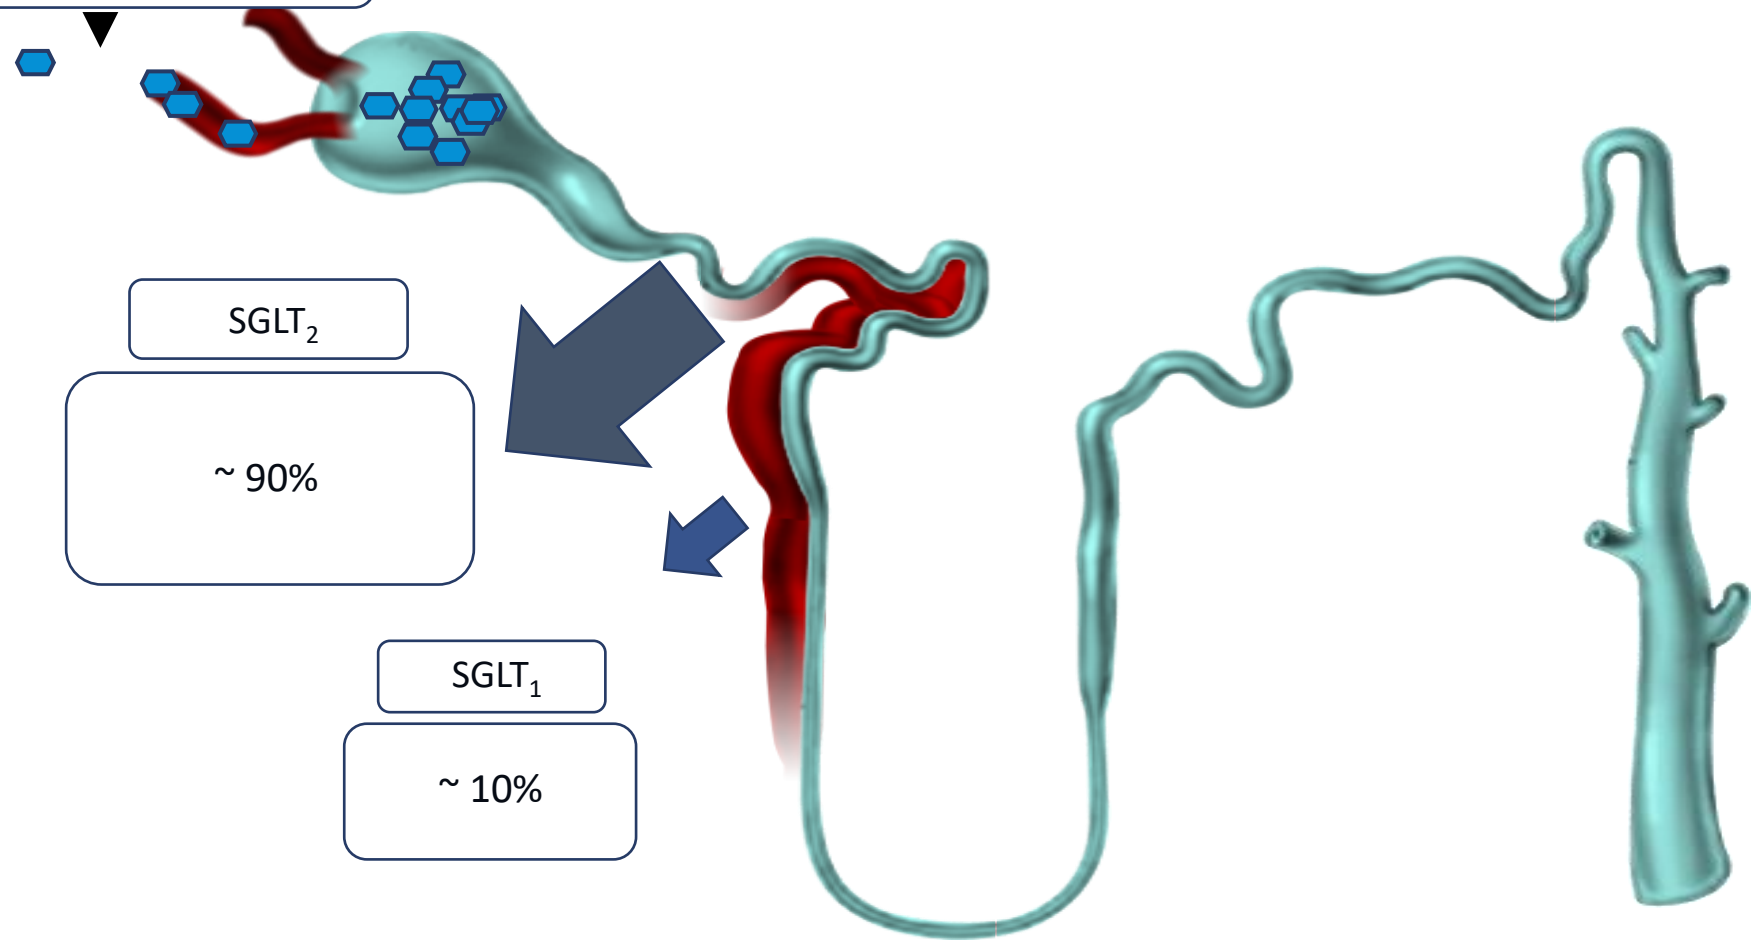
Renal glucose re-absorption in healthy individuals



1-Gerich JE. Role of the kidney in normal glucose homeostasis and in the hyperglycaemia of diabetes mellitus: therapeutic implications. Diabetic Medicine. 2010; 27(2): 136-42.

Renal glucose re-absorption in patients with diabetes

Filtered glucose load > 180[1] g/day



$SGLT_2$

~ 90%

$SGLT_1$

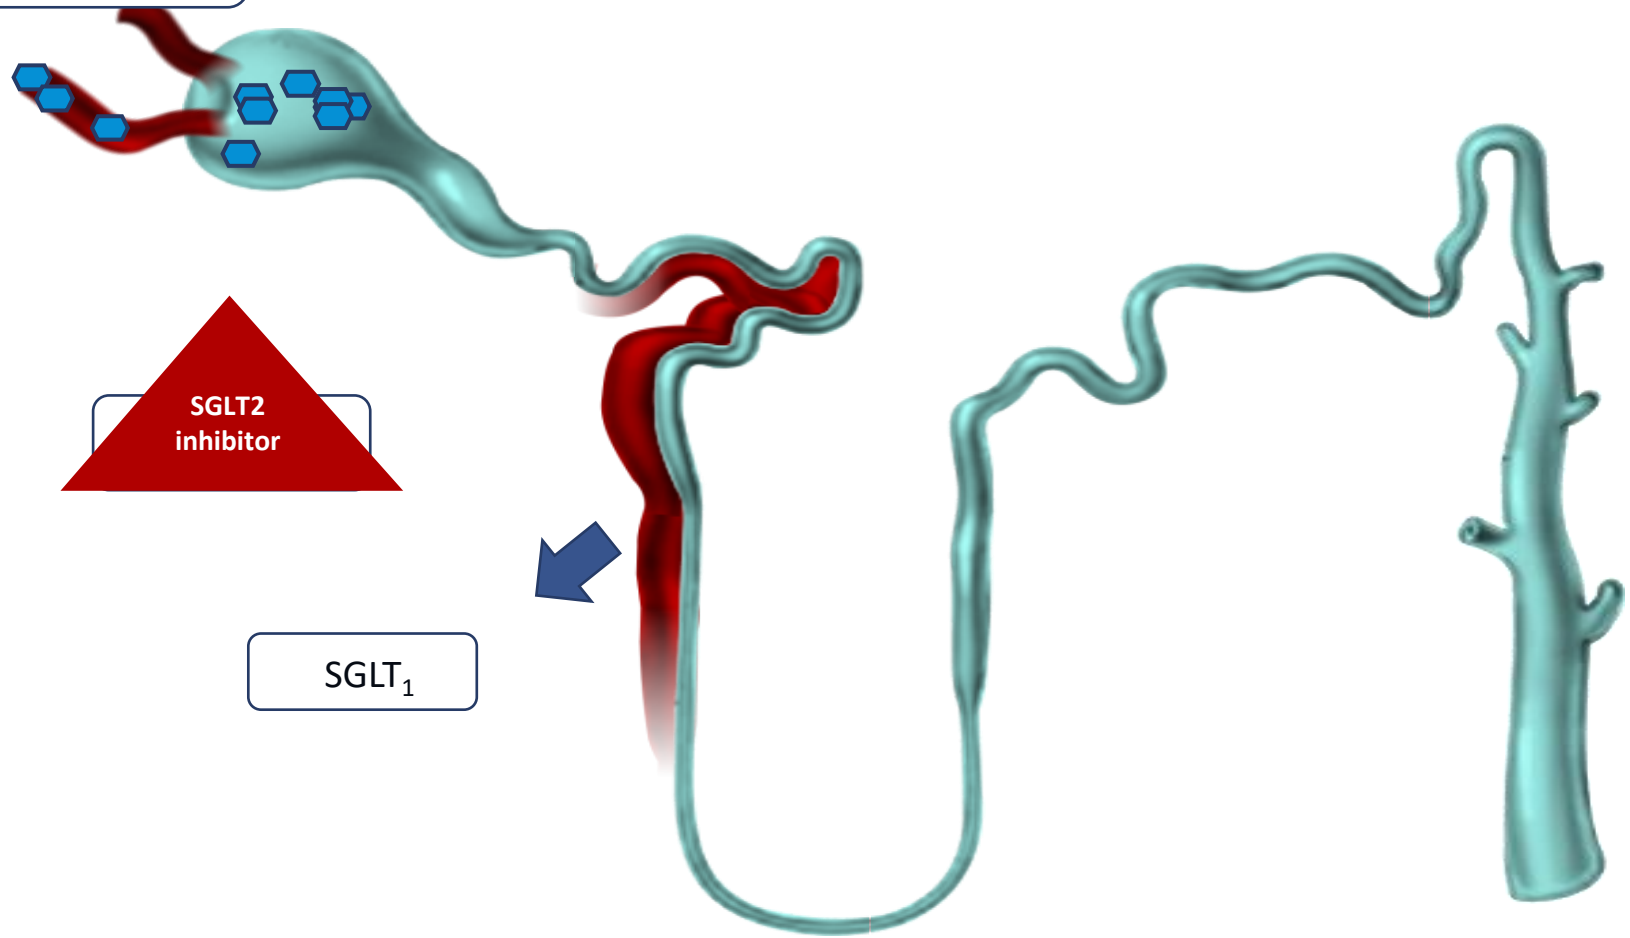
~ 10%

When blood glucose increases above the renal threshold *(~ 180 mg/dL),* the capacity of the transporters is exceeded, resulting in urinary glucose excretion[1]

1-Gerich JE. Role of the kidney in normal glucose homeostasis and in the hyperglycaemia of diabetes mellitus: therapeutic implications. Diabetic Medicine. 2010; 27(2): 136-42.

Urinary glucose excretion via SGLT2 inhibition

Filtered glucose load
> 180 g/day



$SGLT_2$ inhibitors reduce glucose re-absorption in the proximal tubule, leading to urinary glucose excretion* and osmotic diuresis[1]

***Loss of ~ 80 g of glucose/day**

1-Gerich JE. Role of the kidney in normal glucose homeostasis and in the hyperglycaemia of diabetes mellitus: therapeutic implications. Diabetic Medicine. 2010; 27(2):136-42.

SGLT2i lowers renal threshold for glucose excretion[1,2]

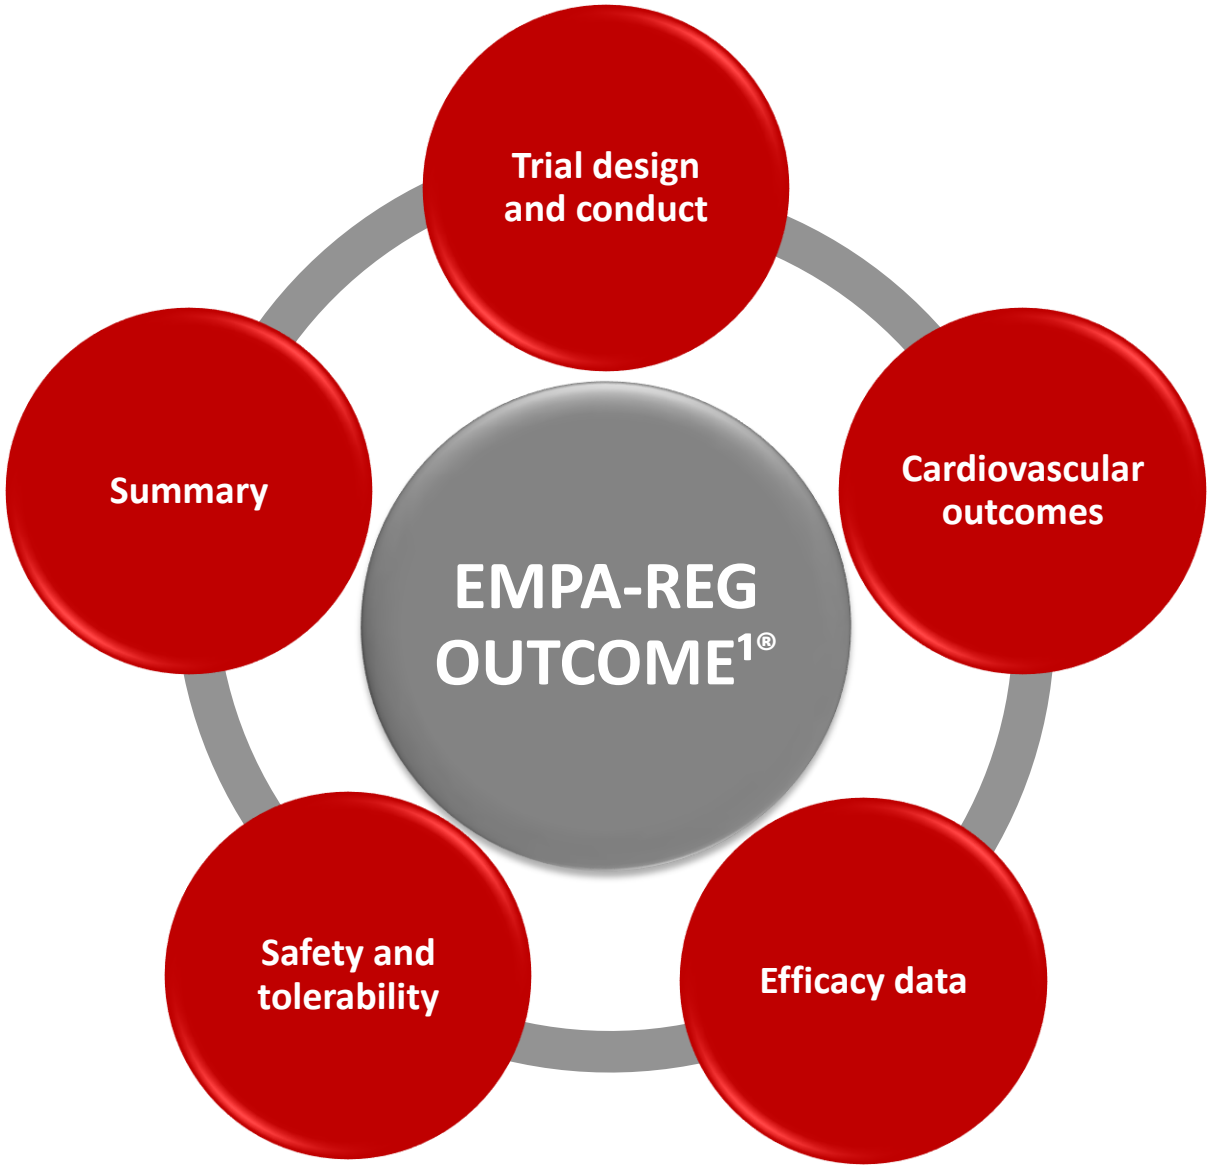
Empagliflozin, Cardiovascular Outcomes, and Mortality in Type 2 Diabetes

Bernard Zinman, M.D., Christoph Wanner, M.D., John M. Lachin, Sc.D., David Fitchett, M.D., Erich Bluhmki, Ph.D., Stefan Hantel, Ph.D., Michaela Mattheus, Dipl. Biomath., Theresa Devins, Dr.P.H., Odd Erik Johansen, M.D., Ph.D., Hans J. Woerle, M.D., Uli C. Broedl, M.D., and Silvio E. Inzucchi, M.D., for the EMPA-REG OUTCOME Investigators

Objective[1]

To examine the long-term effects of empagliflozin versus placebo, in addition to standard of care, on CV morbidity and mortality in patients with type 2 diabetes and high risk of CV events

1-Zinman B et al,. Empagliflozin, cardiovascular outcomes, and mortality in type 2 diabetes. New England Journal of Medicine. 2015; 26;373(22):2117-28.



1-Zinman B et al,. Empagliflozin, cardiovascular outcomes, and mortality in type 2 diabetes. New England Journal of Medicine. 2015; 26;373(22):2117-28.

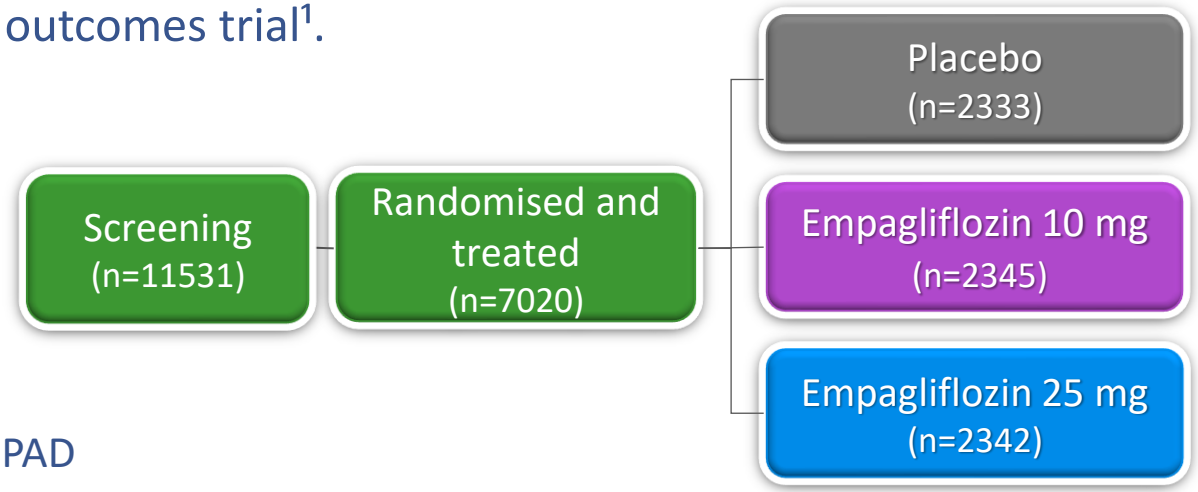
Trial Design[1]

EMPA-REG OUTCOME

- **Design**
  - Randomized, double-blind, placebo-controlled CV outcomes trial[1].
- **Key inclusion criteria**
  - Adults with T_2DM
  - BMI ≤45 *kg/m²*
  - HbA_{1c} 7–10%*
  - Established cardiovascular disease
    - Prior MI, CAD, stroke, unstable angina or occlusive PAD
- **Key exclusion criteria**
  - eGFR <30 *mL/min/1.73m²* (MDRD)



✓ The trial was to continue until at least 691 patients experienced an adjudicated primary outcome event.

BMI, body mass index; eGFR, estimated glomerular filtration rate; MDRD, Modification of Diet in Renal Disease
*No glucose-lowering therapy for ≥12 weeks prior to randomisation or no change in dose for ≥12 weeks prior to randomisation or, in the case of insulin, unchanged by >10% compared to the dose at randomisation

EMPA-REG OUTCOME®: Summary

Empagliflozin in addition to standard of care reduced CV risk and improved overall survival in adults with T2D at high CV risk[1]

14%

↓ 3P-MACE

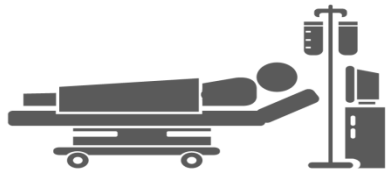
38%

↓ CV death

32%

↓ All-cause mortality

35%



↓ Heart failure hospitalisations

The overall safety profile of empagliflozin was consistent with previous clinical trials and current label information[1]

3P-MACE, 3-point major adverse cardiovascular events
Empagliflozin is not indicated for CV risk reduction. CV, cardiovascular; T2D, type 2 diabetes

Cardiovascular and Renal Outcomes with Empagliflozin in Heart Failure

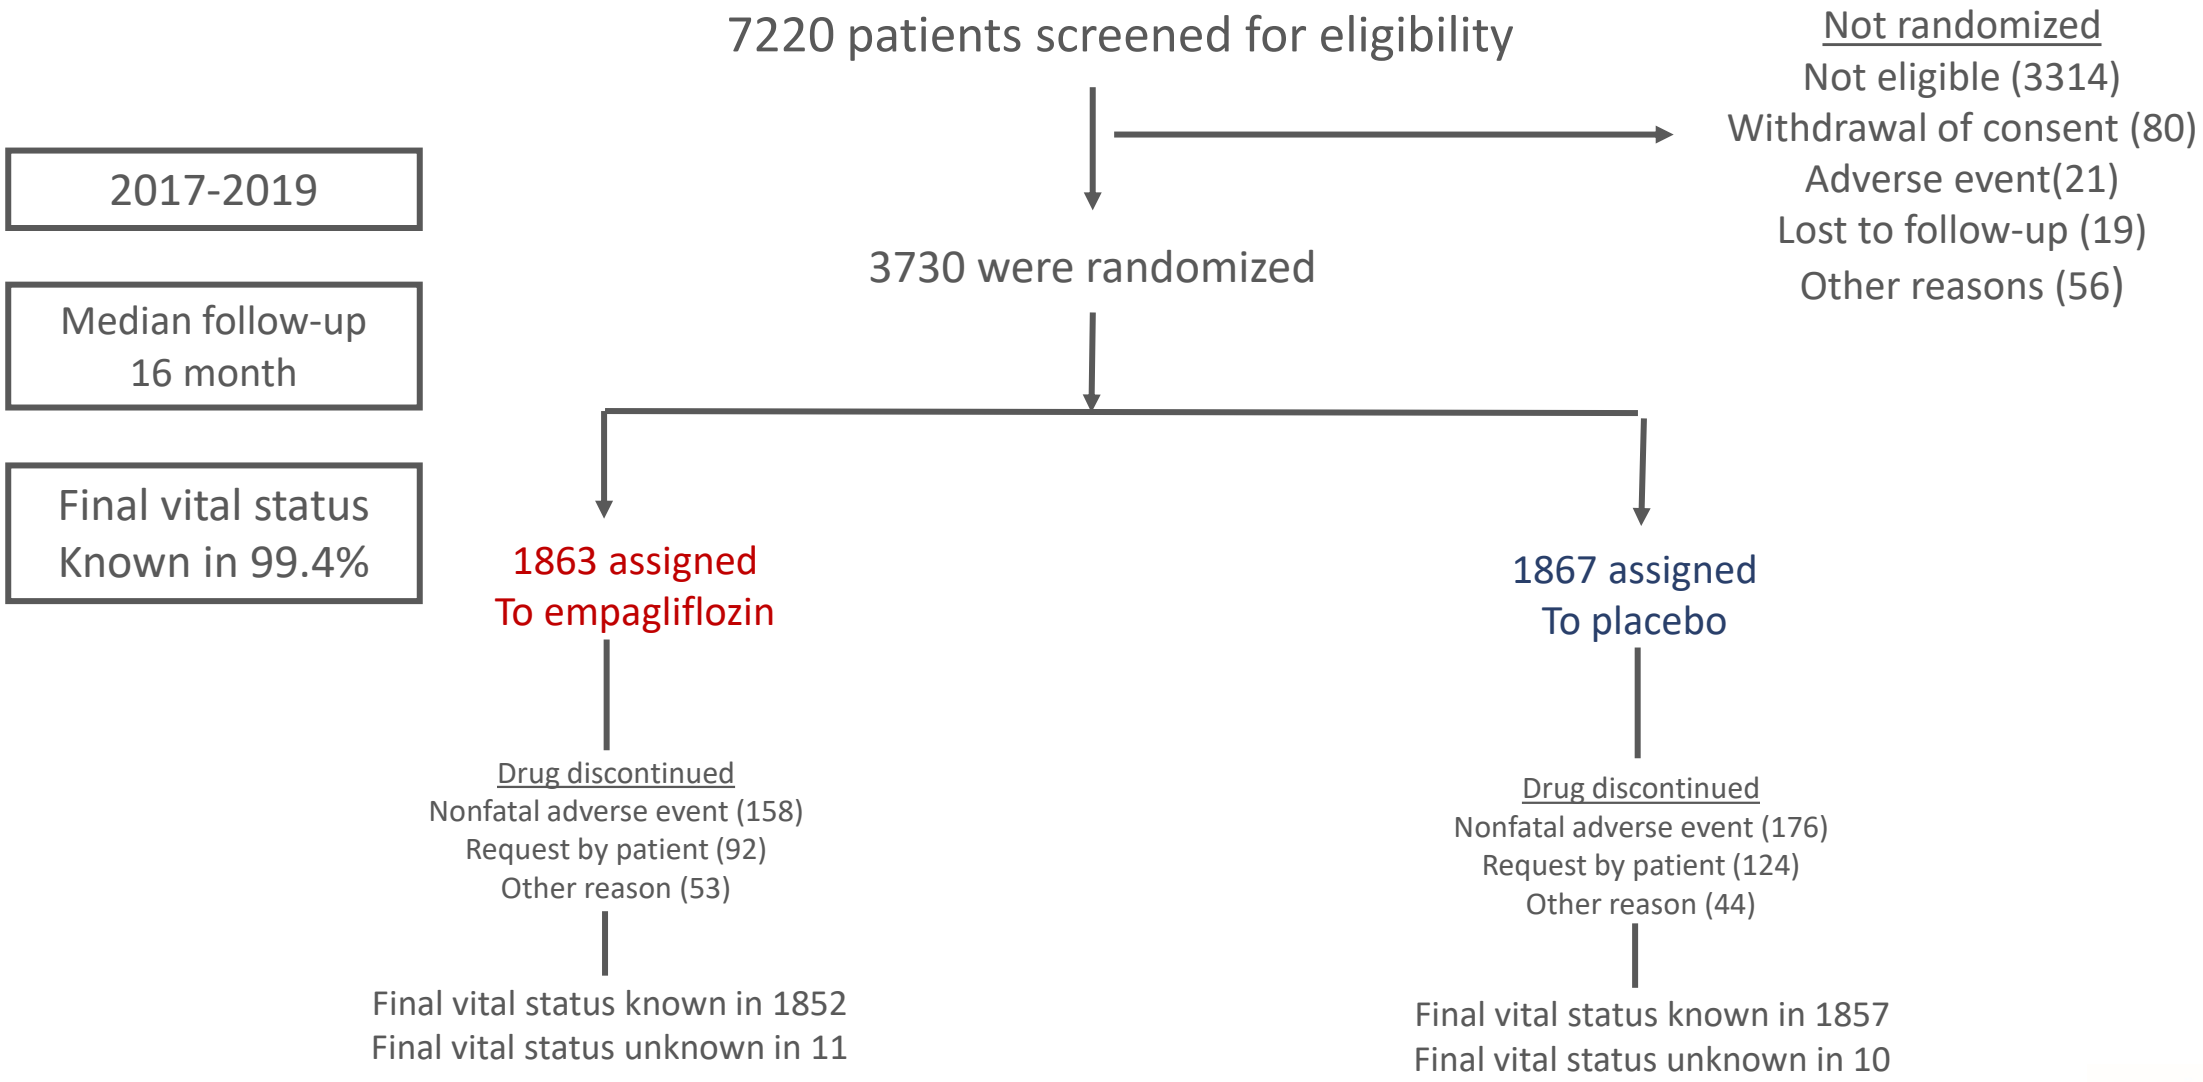
M. Packer, S.D. Anker, J. Butler, G. Filippatos, S.J. Pocock, P. Carson, J. Januzzi, S. Verma, H. Tsutsui, M. Brueckmann, W. Jamal, K. Kimura, J. Schnee, C. Zeller, D. Cotton, E. Bocchi, M. Böhm, D.-J. Choi, V. Chopra, E. Chuquiure, N. Giannetti, S. Janssens, J. Zhang, J.R. Gonzalez Juanatey, S. Kaul, H.-P. Brunner-La Rocca, B. Merkely, S.J. Nicholls, S. Perrone, I. Pina, P. Ponikowski, N. Sattar, M. Senni, M.-F. Seronde, J. Spinar, I. Squire, S. Taddei, C. Wanner, and F. Zannad, for the EMPEROR-Reduced Trial Investigators*

Objective[1]:

The **EMPEROR-Reduced trial** was designed to evaluate the effects of empagliflozin 10 mg once daily (as compared with placebo) in patients with heart failure and a **reduced** ejection fraction, with or without diabetes, who were already receiving all appropriate treatments for heart failure.

1-N. Engl. J. Med 2020 Aug 29.

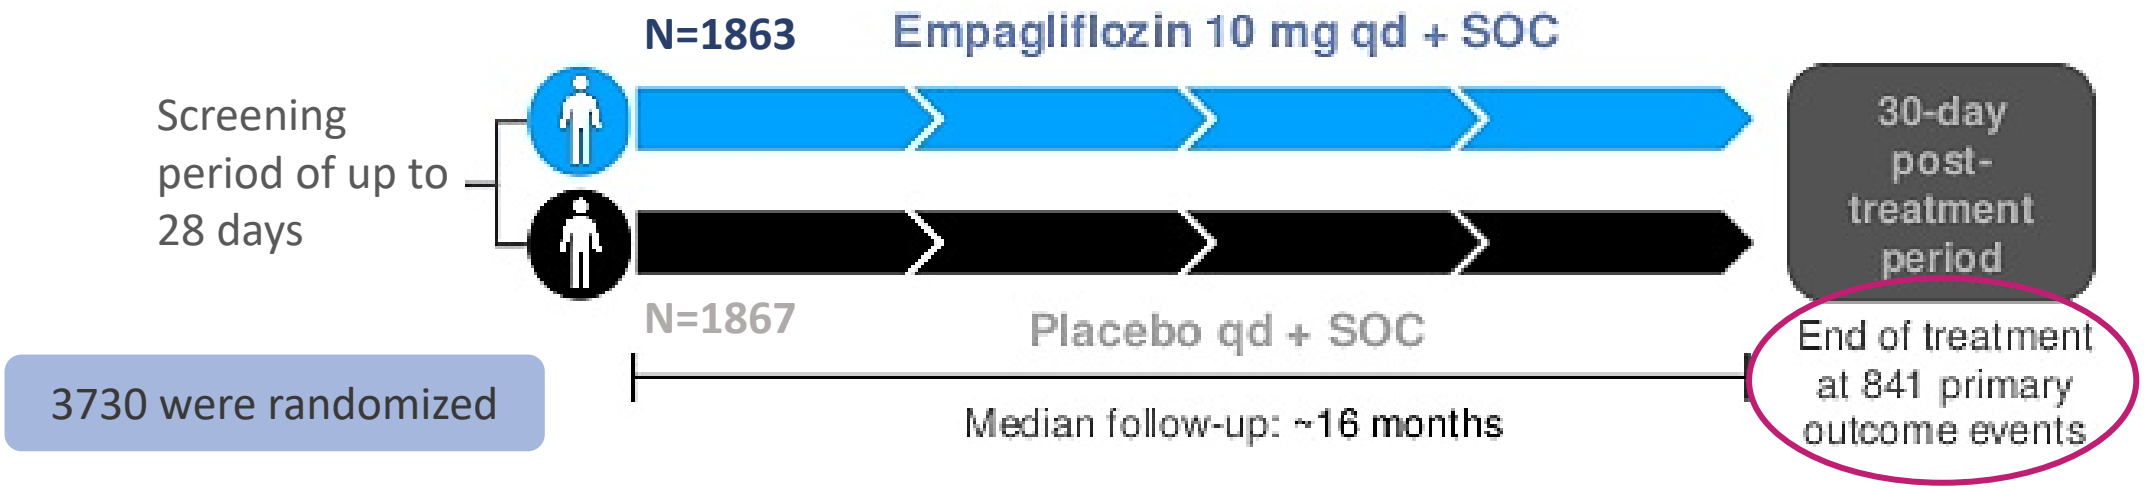
EMPEROR-Reduced: Patient Disposition[1]



1-N. Engl. J. Med 2020 Aug 29.

Trial Design[1]

Patients must be receiving all appropriate treatments for HF



SOC; Standard Of Care

1-N. Engl. J. Med 2020 Aug 29.

EMPEROR-Reduced trial specified only three endpoints to be tested in hierarchical manner[1]

✓ Primary End point

Composite of cardiovascular death Or heart failure hospitalization

✓ First Secondary End point

Total (first and recurrent) heart failure hospitalization

✓ Second Secondary End point

Slope of decline in glomerular Filtration rate over time

✓ Other pre-specific end points:

Composite renal endpoints, KCCQ clinical summary score, total number of hospitalization for any reason , all-cause mortality, new onset diabetes

1-N. Engl. J. Med 2020 Aug 29.

abidi DIABETES

Inclusion criteria[1]

The study included patients with **Chronic HF** with reduced ejection fraction

Key inclusion criteria:

- NYHA class II-IV
- Elevated NT-pro BNP
- Guideline recommendation medication stable ≥1 week prior to first visit
- eGFR ≥20 ml/min/1.73 m^2

EF%	NT-proBNP (pg/ml) Patients without AF	NT-proBNP (pg/ml) Patients with AF
≥36 to ≤40	≥2500	≥5000
≥31 to ≤35	≥1000	≥2000
≤30	≥600	≥1200
> 40+HHF within 12 months	≥600	≥1200

NYHA; New York Heart Association

1-N. Engl. J. Med 2020 Aug 29.

Base-Line Characteristic of Patients[1]

Characteristic	Empagliflozin (N=1863)	Placebo (N=1867)

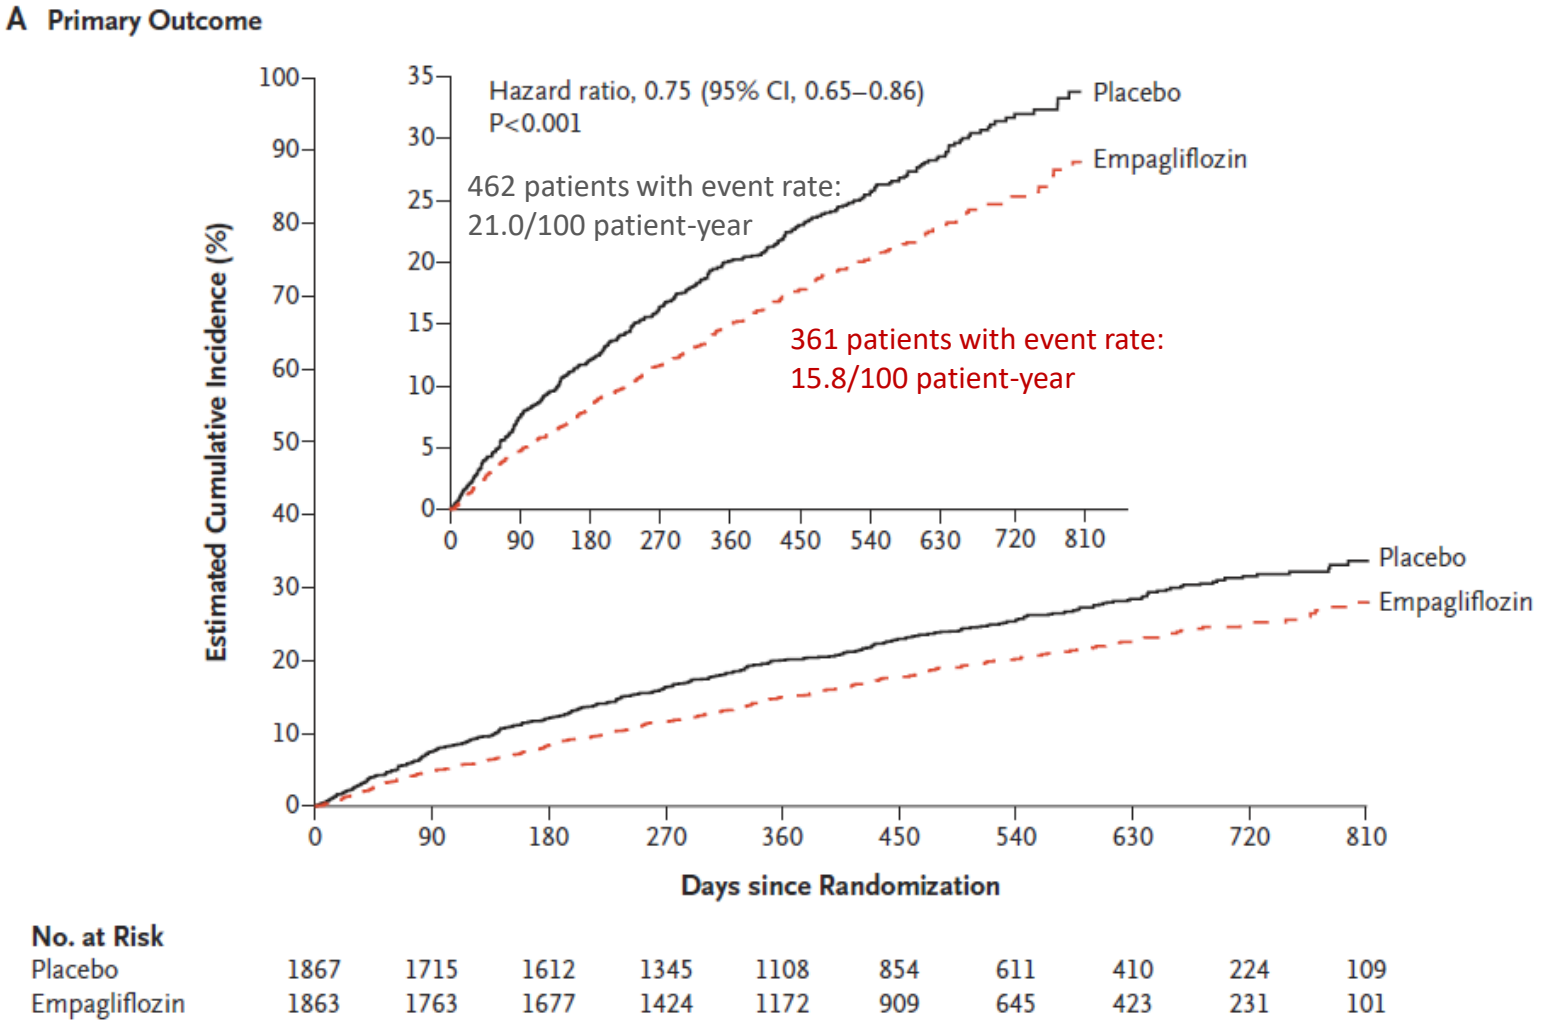
Empagliflozin Group Had Lower Incidence of Cardiovascular Death or Hospitalization for Heart Failure[1]



25% RRR

p<0.001

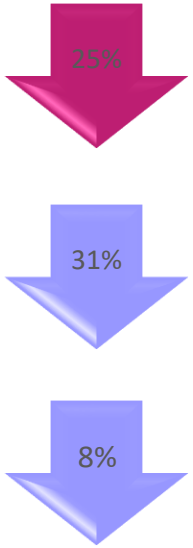
19.4% vs 24.7%

HR = 0.75 (0.65-0.86)

1-N. Engl. J. Med 2020 Aug 29.

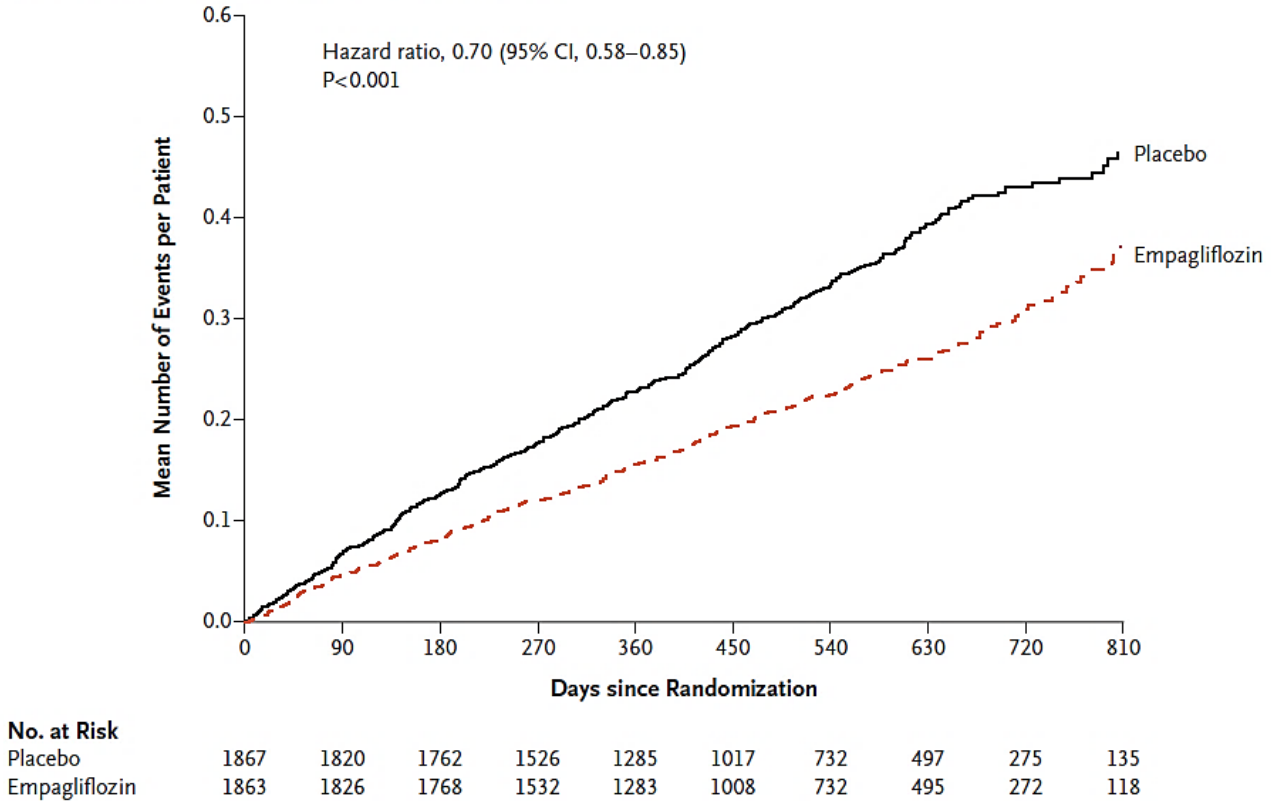
Effect on individual components of the primary endpoint[1]

	Empagliflozin (n=1863)		Placebo (n=1867)		Hazard Ratio (95% CI)	P value
	Number of events (%)	Events/100 patient-yr	Number of events (%)	Events/100 patient-yr		
Primary composite outcome	361 (19.4%)	15.8	462 (24.7%)	21.0	0.75 (0.65 – 0.86)	<0.001
First hospitalization for heart failure	246 (13.2%)	10.7	342 (18.3%)	15.5	0.69 (0.59 – 0.81)	
Cardiovascular death	187 (10.0%)	7.6	202 (10.8%)	8.1	0.92 (0.75 – 1.12)	



1-N. Engl. J. Med 2020 Aug 29.

Empagliflozin-Treated Patients Had lower Risk of Hospitalization for Heart Failure[1]



No. at Risk										
Placebo	1867	1820	1762	1526	1285	1017	732	497	275	135
Empagliflozin	1863	1826	1768	1532	1283	1008	732	495	272	118

30% RRR

p<0.001

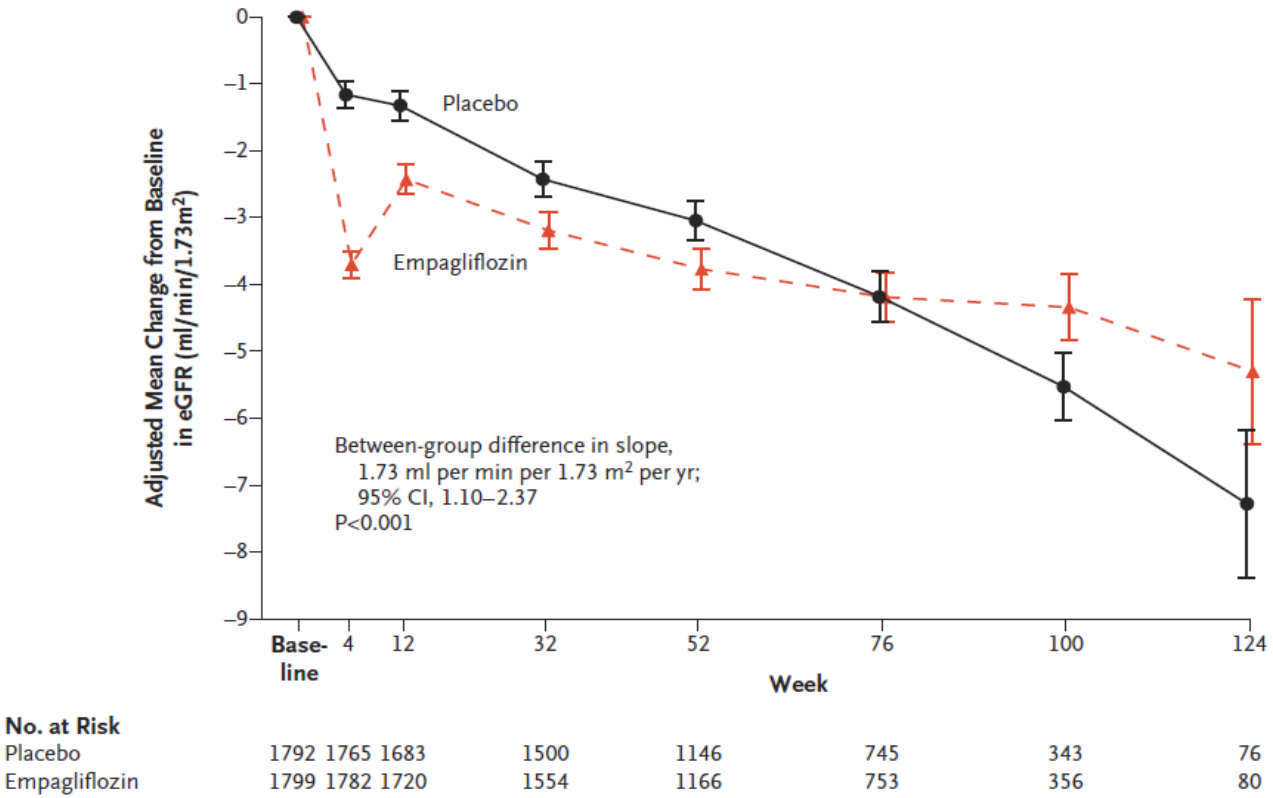
388 Vs 553

HR=0.70 (0.58-0.85)

✓ The total number of hospitalizations for heart failure was lower in the empagliflozin group than in the placebo group, with 388 events and 553 events, respectively (hazard ratio, 0.70; 95% CI, 0.58 to 0.85; P<0.001)

1-N. Engl. J. Med 2020 Aug 29.

Empagliflozin Decreased the Slope of eGFR Reduction Significantly Over the Time vs Placebo[1]



–2.28 ml / min / 1.73 m² / year
On placebo

– 0.55 ml /min/1.73 m² / year
On Empagliflozin

1.73 ml / min / 1.73 m² / year

P < 0.001

✓ Empagliflozin was associated with a slower progressive decline in renal function in patients with chronic HF and a reduced EF, regardless of the presence or absence of diabetes[2].

1- N. Engl. J. Med 2020 Aug 29.

2- EMPEROR-Reduced Trial Marta Cobo Marcos M. Packer presentation ESC 2020

abidi DIABETES

EMPEROR-Reduced trial achieved all three hierarchically specified endpoints at p<0.001[1]

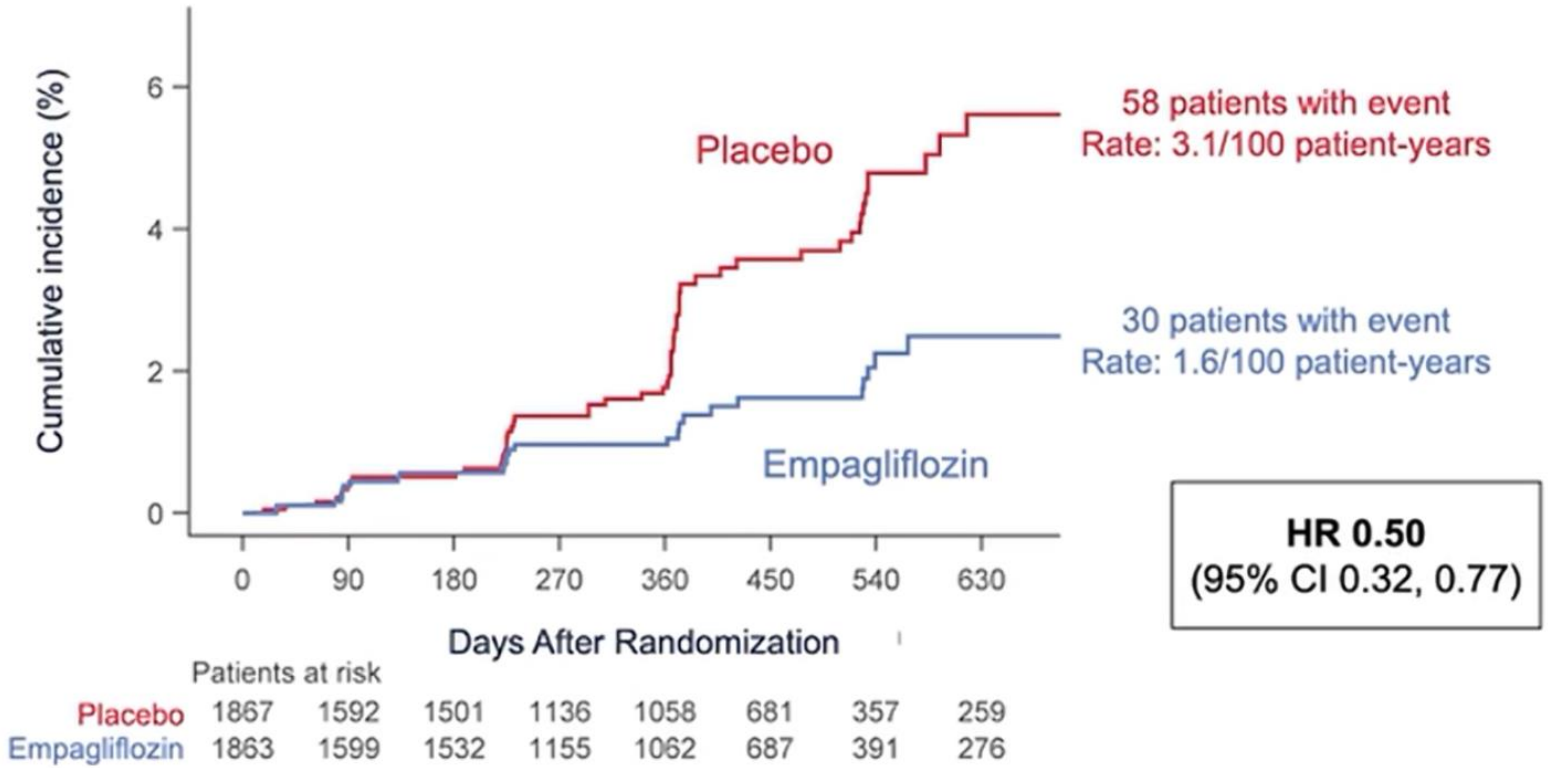
	**Primary Endpoint** Composite of cardiovascular death or heart failure hospitalization	**Achieved** **P < 0.001**
	**First Secondary Endpoint** Total (first and recurrent heart failure hospitalizations)	**Achieved** **P < 0.001**
	**Second Secondary Endpoint** Slope of decline in glomerular filtration rate over time	**Achieved** **P < 0.001**

Also achieved success on composite renal endpoint, KCCQ clinical summary score, and total number of hospitalizations for any reason (all nominal P < 0.01)

1- EMPEROR-Reduced Trial Marta Cobo Marcos M. Packer presentation ESC 2020

abidi DIABETES

Empagliflozin reduced composite renal endpoint by 50%[1]



50% composite renal endpoint reduction

✓ a composite renal outcome (chronic dialysis or renal transplantation or a profound, sustained reduction in the estimated GFR) occurred in 30 patients (1.6%) in the empagliflozin group and in 58 patients (3.1%) in the placebo group (hazard ratio, 0.50; 95% CI, 0.32 to 0.77)

EMPEROR-Reduced: Adverse events[1]

- ✓ Uncomplicated genital tract infection was reported more frequently with empagliflozin than with placebo[2].
- ✓ Safety concerns that have been seen with other drugs for heart Failure (e.g., hypotension, volume depletion, renal dysfunction, bradycardia, and hyperkalemia) were not evident with empagliflozin[2].

	Empagliflozin (n=1863)	Placebo (n=1863)
Serious adverse events	772 (41.4)	896 (48.1)
Related to cardiac disorder	**500 (26.8)**	**634 (34.0)**
Related to worsening renal function	**59 (3.2)**	**95 (5.1)**
Selected adverse events of special interest		
Volume depletion	197 (10.6)	184 (9.9)
Hypotension	176 (9.4)	163 (8.7)
Symptomatic hypotension	106 (5.7)	103 (5.5)
Hypoglycemia	27 (1.4)	28 (1.5)
Ketoacidosis	0 (0.0)	0 (0.0)
Urinary tract infections	91 (4.9)	83 (4.5)
Genital tract infections	31 (1.7)	12 (0.6)
Bone fractures	45 (2.4)	42 (2.3)
Lower limb amputations	13 (0.7)	10 (0.5)

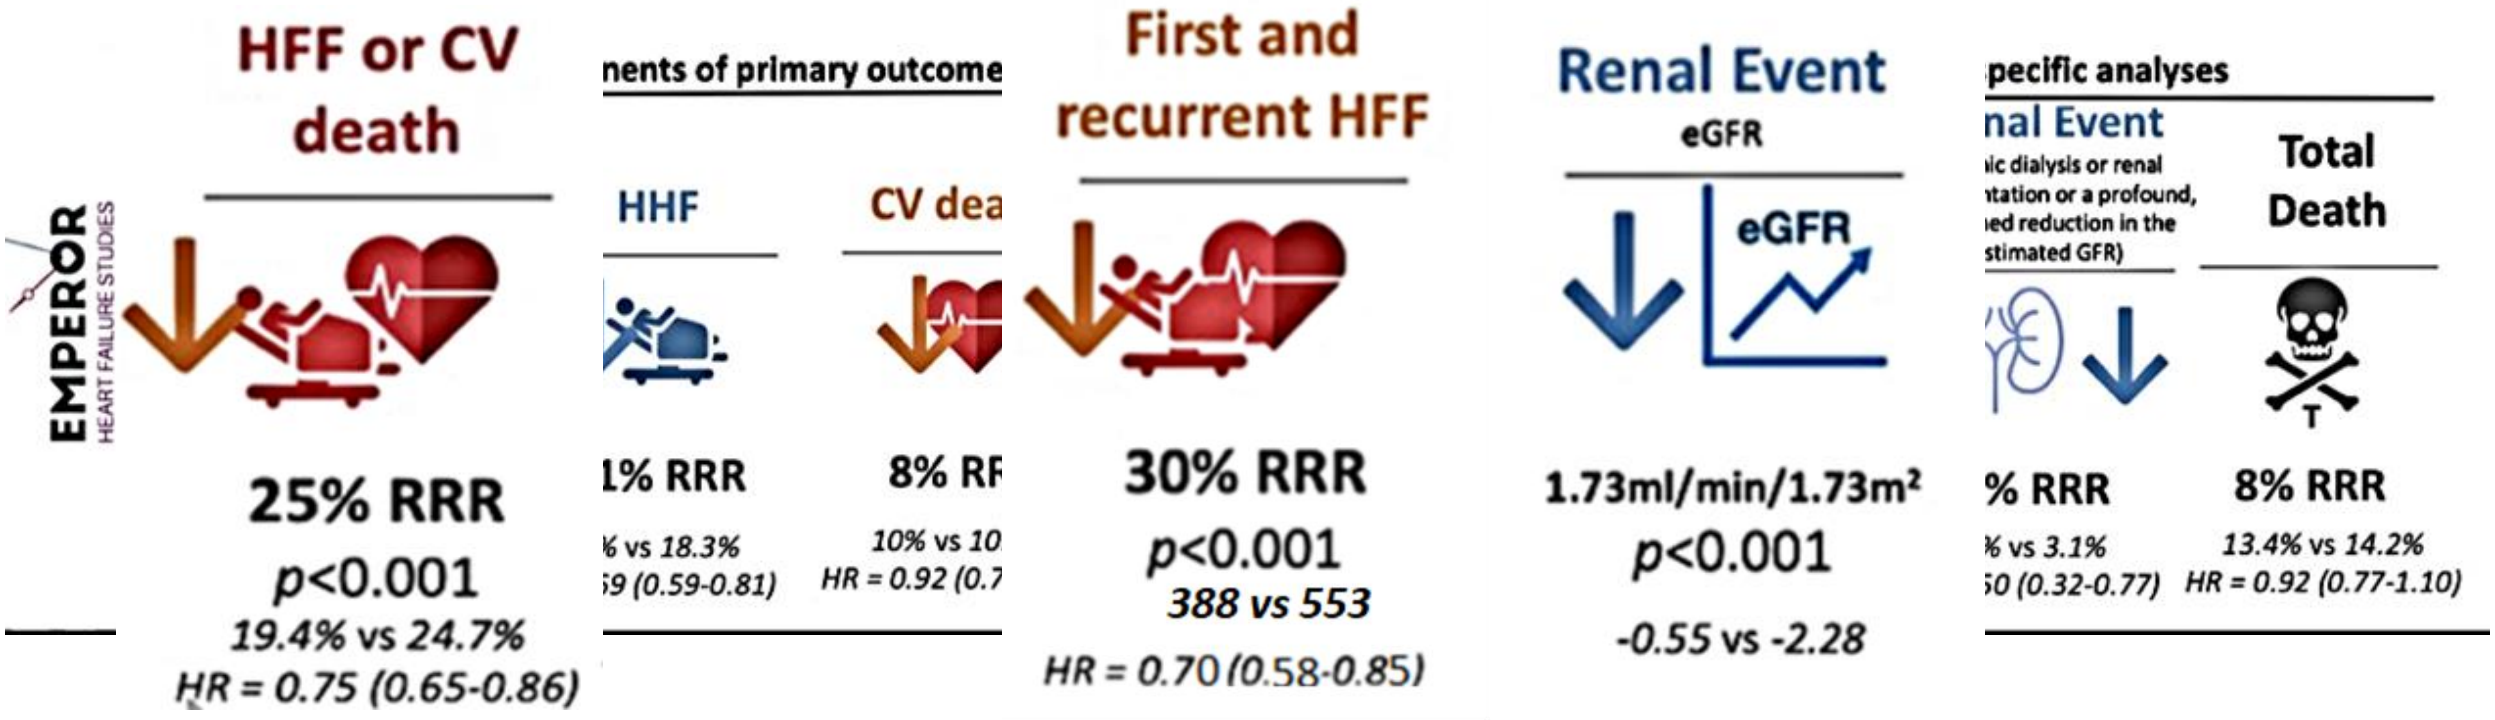
abidi DIABETES

Conclusion[1]



- ✓ Overall, in this trial, empagliflozin was associated with a lower combined risk of cardiovascular death or hospitalization for heart failure than placebo and with a slower progressive decline in renal function in patients with chronic heart failure and a reduced ejection fraction, regardless of the presence or absence of diabetes.

1. Proven CVD benefit means it has label indication of reducing CVD events
2. Low dose may be better tolerated though less well studied for CVD effects
3. Degludec or U-100 glargine have demonstrated CVD safety
4. Choose later generation SU to lower risk of hypoglycemia; glimepiride has shown similar CV safety to DPP-4i
5. Be aware that SGLT2i labelling varies by region and individual agent with regard to indicated level of eGFR for initiation and continued use
6. Empagliflozin, canagliflozin, and dapagliflozin have shown reduction in HF and to reduce CKD progression in CVOTs. Canagliflozin and dapagliflozin have primary renal outcome data. Dapagliflozin and empagliflozin have primary heart failure outcome data.
7. Proven benefit means it has label indication of reducing heart failure in this population
8. Refer to Section 11: Microvascular Complications and Foot Care
9. Degludec / glargine U-300 < glargine U-100 / detemir < NPH insulin
10. Semaglutide > liraglutide > dulaglutide > exenatide > lixisenatide
11. If no specific comorbidities (i.e., no established CVD, low risk of hypoglycemia, and lower priority to avoid weight gain or no weight-related comorbidities)
12. Consider country- and region-specific cost of drugs. In some countries TZDs are relatively more expensive and DPP-4i are relatively cheaper.

† Actioned whenever these become new clinical considerations regardless of background glucose-lowering medications.
* Most patients enrolled in the relevant trials were on metformin at baseline as glucose-lowering therapy.

Administration, Cautions, Side effects, Safety profile

Convenience of a once-daily oral treatment[1]

- ✓Recommended starting dose 10 mg once daily
- ✓Can be taken with/without food in the morning
- ✓Dose may be increased to 25 mg once daily
- ✓Can be used alone or in combination with other common therapies:
  - ✓A lower dose of insulin or insulin secretagogues (eg, sulphonylureas) may be needed to reduce the risk of hypoglycaemia when empagliflozin is used in combination with these agents

1-Jardiance FDA label 2018. Reference ID: 4367802

Empagliflozin in Patients with Renal Impairment

- ✓No dose adjustment is needed if eGFR≥ 45 mL/min/1.73 m^2
- ✓Empagliflozin should not be initiated in patients with an eGFR <45 mL/min/1.73 m^2
- ✓Discontinue JARDIANCE if eGFR falls persistently below 45 mL/min/1.73 m^2
- ✓Assess renal function prior to initiating SGLT2 inhibitor treatment and periodically thereafter

1-Jardiance FDA label 2018. Reference ID: 4367802

Empagliflozin Safety Profile[1]

System organ class	Very common (≥1/10)	Common (≥1/100 to <1/10)	Uncommon (≥1/1,000 to <1/100)	Rare (≥1/10,000 to <1/1,000)
Infections and infestations		Vaginal moniliasis, vulvovaginitis, balanitis and other genital infection Urinary tract infection		
Metabolism and nutrition disorders	Hypoglycaemia (when used with SU or insulin)			Diabetic Ketoacidosis*
Skin and subcutaneous disorders		Pruritis (generalised)		
Vascular disorders			Volume depletion	
Renal and urinary disorders		Increased urination	Dysuria	

1-Jardiance FDA label 2018. Reference ID: 4367802

Summary

Favorable effects of empagliflozin:

- Weight loss
- HbA_{1c} lowering
- Reduced blood pressure
- Renal & cardiac protection
- Independent to insulin presence
- Mechanism complementary to other therapies
- Reduction of Heart failure hospitalisations in patients with T2D
