

Applying novel antithrombotic therapy in the secondary prevention of chronic CVD

COMPASS CAD & PAD

Dr Mitra Niafar, MD

Professor of Endocrinology & Metabolism
Department of Internal Medicine, School of Medicine
Endocrine Research Center
Tabriz University of Medical Sciences

Dual pathway inhibition in Stable Cardiovascular Disease

(Rivaroxaban 2.5 mg BD + Aspirin 75-100 mg OD)

154 MILLION
PATIENTS WITH CAD

120 MILLION
PATIENTS WITH PAD

Key trials of anti-thrombotic therapy in chronic coronary syndrome patients

Dual Anti platelet
therapy extension
after 1 year

DAPT Trial

ASA vs ASA + Clopidogrel

PEGASUS Trial

ASA vs ASA + Ticagrelor

Dual pathway inhibition
after 1 year

FDA APPROVED

COMPASS Trial

ASA vs ASA + Rivaroxaban 2.5 mg BD

Important points:

Only in COMPASS Trial:

- ✓ The study was completed earlier
- ✓ Patients had chronic CAD & PAD
- ✓ 27% of Patients had PAD
- ✓ 22% of patients had heart failure (EF > 30)
- ✓ **COMPASS Trial had Less Discontinuation Rate**

Rivaroxaban with or without Aspirin in Stable Cardiovascular Disease

J.W. Eikelboom, S.J. Connolly, J. Bosch, G.R. Dagenais, R.G. Hart, O. Shestakovska, R. Diaz, M. Alings, E.M. Lonn, S.S. Anand, P. Widimsky, M. Hori, A. Avezum, L.S. Piegas, K.R.H. Branch, J. Probstfield, D.L. Bhatt, J. Zhu, Y. Liang, A.P. Maggioni, P. Lopez-Jaramillo, M. O'Donnell, A.K. Kakkar, K.A.A. Fox, A.N. Parkhomenko, G. Ertl, S. Störk, M. Keltai, L. Ryden, N. Pogosova, A.L. Dans, F. Lanus, P.J. Commerford, C. Torp-Pedersen, T.J. Guzik, P.B. Verhamme, D. Vinereanu, J.-H. Kim, A.M. Tonkin, B.S. Lewis, C. Felix, K. Yusoff, P.G. Steg, K.P. Metsarinne, N. Cook Bruns, F. Misselwitz, E. Chen, D. Leong, and S. Yusuf, for the COMPASS Investigators*

COMPASS trial

Rivaroxaban with or without Aspirin in Stable Cardiovascular Disease

Inclusion Criteria

- Presence of CAD or PAD
 - CAD defined as any of:
 - MI within the last 20 years
 - Multivessel CAD with symptoms or with history of stable or unstable angina
 - Multivessel PCI/CABG
 - PAD defined as any of:
 - Previous limb bypass surgery or PTCA
 - Previous limb or foot amputation for arterial vascular disease
 - History of claudication (with either of ABI < 0.90 or $\geq 50\%$ stenosis of peripheral artery by angio. or US
 - Previous carotid revascularization or asymptomatic carotid stenosis $\geq 50\%$ by angio. or US
- If included for CAD, also requires either of:
 - Age ≥ 65 years
 - Age < 65 years with documented atherosclerosis or revascularization involving at least 1 additional vascular bed or presence of at least 2 of:
 - Current smoker / Diabetes / eGFR < 60mL/min/ Heart failure/ Non-lacunar stroke ≥ 1 month

COMPASS trial

Rivaroxaban with or without Aspirin in Stable Cardiovascular Disease

Exclusion criteria

- high bleeding risk
- a recent stroke or previous hemorrhagic or lacunar stroke
- severe heart failure
- advanced stable kidney disease (estimated GFR <15 ml per minute)
- the use of dual antiplatelet therapy, anticoagulation, or other antithrombotic therapy
- Non cardiovascular conditions deemed by the investigator to be associated with a poor prognosis.

BLEEDING RISK

Table 7 Major and minor criteria for high bleeding risk according to the Academic Research Consortium for High Bleeding Risk at the time of percutaneous coronary intervention (bleeding risk is high if at least one major or two minor criteria are met)

Major	Minor
● Anticipated use of long-term OAC ^a	● Age ≥ 75 years
● Severe or end-stage CKD (eGFR <30 mL/min)	● Moderate CKD (eGFR 30–59 mL/min)
● Haemoglobin <11 g/dL	● Haemoglobin 11–12.9 g/dL for men or 11–11.9 g/dL for women
● Spontaneous bleeding requiring hospitalization and/or transfusion in the past 6 months or at any time, if recurrent	● Spontaneous bleeding requiring hospitalization and/or transfusion within the past 12 months not meeting the major criterion
● Moderate or severe baseline thrombocytopenia ^b (platelet count $<100 \times 10^9/L$)	● Chronic use of oral non-steroidal anti-inflammatory drugs or steroids
● Chronic bleeding diathesis	● Any ischaemic stroke at any time not meeting the major criterion
● Liver cirrhosis with portal hypertension	
● Active malignancy ^c (excluding non-melanoma skin cancer) within the past 12 months	
● Previous spontaneous intracranial haemorrhage (at any time)	
● Previous traumatic intracranial haemorrhage within the past 12 months	
● Presence of a brain arteriovenous malformation	
● Moderate or severe ischaemic stroke ^d within the past 6 months	
● Recent major surgery or major trauma within 30 days prior to PCI	
● Non-deferrable major surgery on DAPT	

Rivaroxaban with or without Aspirin in Stable Cardiovascular Disease (PAD, CAD)

Prospective, multi-center, double-blind,
3-by-2 partial factorial design, randomized controlled trial,
N=27,395, 602 centers in 33 countries

Aspirin alone

ASA₁₀₀ + Rivaroxaban_{2.5} BID

RvRx₅ BID

- Rivaroxaban and aspirin (n=9152)
- Rivaroxaban alone (n=9117)
- Aspirin alone (n=9126)
- **Mean follow-up:** 3-4 years
- **Primary outcome:** Cardiovascular death, stroke, or nonfatal MI

Net clinical benefit per 1000 patients

2020 ESC Guidelines

Prolonging antithrombotic treatment duration

Adding a second antithrombotic agent to aspirin for extended long-term secondary prevention should be considered in patients with a **high risk of ischaemic events** and without increased risk of major or life-threatening bleeding (see *Tables 9 and 11* for options).^{162,212,213,214,223}

IIa

A

Adding a second antithrombotic agent to aspirin for extended long-term secondary prevention may be considered in patients **with moderately increased risk of ischaemic events** and without increased risk of major or life-threatening bleeding (see *Tables 9 and 11* for options).^{162,212,213,214,223}

IIb

A

2020 ESC Guideline

High thrombotic risk (Class IIa)

Complex CAD and at least 1 criterion

Risk enhancers

Diabetes mellitus requiring medication

History of recurrent MI

Any multivessel CAD

Polyvascular disease (CAD plus PAD)

Premature (<45 years) or accelerated (new lesion within a 2-year time frame) CAD

Concomitant systemic inflammatory disease (e.g. human immunodeficiency virus, systemic lupus erythematosus, chronic arthritis)

CKD with eGFR 15–59 mL/min/1.73 m²

Technical aspects

At least 3 stents implanted

At least 3 lesions treated

Total stent length >60 mm

History of complex revascularization (left main, bifurcation stenting with ≥2 stents implanted, chronic total occlusion, stenting of last patent vessel)

History of stent thrombosis on antiplatelet treatment

Moderate thrombotic risk (Class IIb)

Non-complex CAD and at least 1 criterion

Diabetes mellitus requiring medication

History of recurrent MI

Polyvascular disease (CAD plus PAD)

CKD with eGFR 15–59 mL/min/1.73 m²

complex vs. non-complex CAD is based on individual clinical judgement with knowledge of patients' cardiovascular history and/or coronary anatomy.

ADA 2021

Combination therapy with aspirin plus low-dose rivaroxaban should be considered for patients with stable coronary and/or peripheral artery disease and low bleeding risk to prevent major adverse limb and cardiovascular events. **A**

Dual pathway inhibition in Peripheral Artery Diseases

(Rivaroxaban 2.5 mg BD + Aspirin 75-100 mg OD)

Current Challenges in PAD

- Under-recognized and underdiagnosed
- Little progress in management during the last few decades
- High burden of disease and complications in patients with PAD
 - Increased risk of all-cause mortality, CV mortality, and morbidity (MI, stroke)

Global Burden of PAD

Global Prevalence^[a]

- 120,000,000
 - 25.6% global burden of CV disease

1999–2000 US NHNE Survey^[b]

- PAD (ABI < 0.90) prevalence
 - ≥ 40 years: 4.3%
 - ≥ 70 years: 14.5%

US Healthcare Insurer Database^[c]

- Mean annual prevalence
 - 10.7%

Yusuf S, et al. *N Engl J Med*. 2001;345:494-502.

Current Treatment Strategies For Patients With PAD

Symptom Improvement

- Exercise training
- Pharmacologic treatments (eg, cilostazol)
- Endovascular intervention (eg, stent placement)
- Surgery (eg, revascularization)

CV Risk Reduction

- Lipid-lowering drugs (eg, statin)
- Antihypertensive drugs (eg, ACE inhibitor)
- Diabetes therapies
- Smoking cessation
- Antiplatelet drugs (eg, aspirin, clopidogrel)

Trials on Intensified Antiplatelet Therapy in Patients With PAD Showed Mixed Results

IN PEGASUS 5% of patients had PAD

Not intended for direct cross-study comparison

*Hospitalization for ALI or lower limb revascularization (individual endpoints); [#]Results presented are for the 60 mg twice daily dose;

[‡]Composite of ALI or peripheral revascularization; [§]No mortality benefit in the overall trial population^[e]

doi:10.1093/eurheartj/ehz486

ESC GUIDELINES

2019 ESC Guidelines on diabetes, pre-diabetes, and cardiovascular diseases developed in collaboration with the EASD

The Task Force for diabetes, pre-diabetes, and cardiovascular
diseases of the European Society of Cardiology (ESC) and the
European Association for the Study of Diabetes (EASD)

RECOMMENDATIONS

2019 ESVM guidelines on the management of PAD

The combined therapy of aspirin 100 mg od and rivaroxaban 2.5 mg bid should be considered in **PAD patients** without a high risk of bleeding or other contraindications

CLASS

IIa

EVIDENCE LEVEL

B

2019 ESC-EASD guidelines on diabetes, pre-diabetes and CVD

In **patients with diabetes and chronic symptomatic LEAD** without high bleeding risk, a combination of low-dose rivaroxaban (2.5 mg bid) and aspirin (100 mg od) should be considered

IIa

B

Concluding Remarks

- Rivaroxaban 2.5 mg twice daily + aspirin 100 mg once daily is a more efficient antithrombotic strategy than current options for patients with PAD
- The efficacy of this combination is consistent during the different periods of the disease course
- There is no need to change this combination or its dose for the different periods of the disease, which is important for long-term treatment adherence

Rivaroxaban 2.5 mg in PAD CLINICAL TRIAL

Not eligible for AXABIN 2.5 mg:

1. High risk of bleeding
2. Stroke within 1 month
3. Any history of haemorrhagic stroke
4. Any history of lacunar stroke
5. Severe heart failure with a known ejection fraction of less than 30%
6. eGFR of less than 15 mL/min
7. Need for dual-antiplatelet therapy or for any nonaspirin antiplatelet therapy

ADA 2021

Combination therapy with aspirin plus low-dose rivaroxaban should be considered for patients with stable coronary and/or peripheral artery disease and low bleeding risk to prevent major adverse limb and cardiovascular events. **A**

Thanks for your attention
